

VISUAL EFFECT OF HIGHER DENSITY EDGES OF CEWOOD PANELS

CEWOOD Panels are available with different edge bevels, which allows to choose the most suitable solution for each object. In order to provide high quality, expressive bevels, all panels are produced with increased density on the two long side edges. This technological solution also ensures safer fastening of the material with screws. If P0 profiles are selected and panels are fastened with screws, then final visual effect will be reached with added aesthetic value – increased density edges on the two long sides of the panels.
